

H2 AWS Definitions

H3 Hypervisor

When used in Cloud computing, the Operating system that is directly installed on top of the hardware is called - **Hypervisor**. It is on top of this Hypervisor that additional, multiple Operating Systems are installed as Virtual Machines (VMs)

- A VM is container within which virtualized resources are installed - vCPU, vRAM
- Example of Type 01 Hypervisor include - VMWare ESXi & Microsoft Hyper-V
- Example of Type 02 Hypervisor include - VMWare workstation & Oracle Virtual Box
- Until now, Amazon was using the Xen Hypervisor which is now transitioned to KVM (Kernel based Virtual Machine)

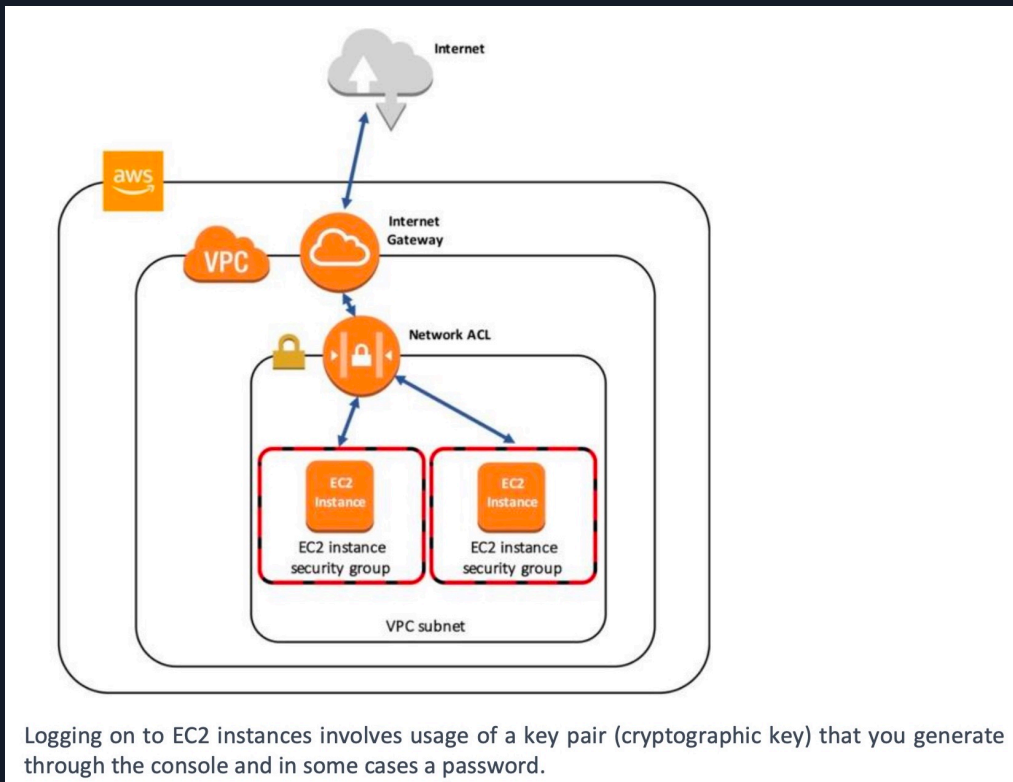

H3 AWS OpsWorks

AWS OpsWorks supports continuous configuration through lifecycle events that automatically update your instances' configuration to adapt to environment changes

- Provides managed instances of Chef & Puppet
- Allows you to use code to automate the configuration of your servers
- Chef & Puppet allow you to define how the servers are configured, deployed & managed across your EC2 instances.

H3 ELB & Auto Scaling

AWS provides ELB & Auto-scaling to evenly distribute incoming connections and make sure the right amount of instances are available to service the load. It does this using Elastic Load Balancer & Auto-scaling

Elastic Load Balancer provides the following benefits -

- High Availability - Automatically distributes incoming traffic across multiple EC2 instances
- Security - Certificate management, SSL / TLS Encryption

EC2 Auto scaling complements the architecture by automatically DYNAMICALLY scaling the number of EC2 instances depending on the load

Auto scaling provides -

- Fault Tolerance - Auto scaling detects when an instance is unhealthy & replaces it
- Scalability & Elasticity

H3 Security Groups

Security Groups are firewalls that protect the individual EC2 Instance and further restrict what traffic can be allowed to the instance.

H3 NACLs

NACLs are firewalls that protect the entire subnet and allow you to define both allow and deny rules for traffic that flows into and out of the subnet. This protects your EC2 Instance the Subnet.

H3 AWS WAF

AWS WAF is an incorrect answer. AWS WAF is a web application firewall that helps protect your web applications or APIs against common web exploits.

- AWS WAF can be used to control how traffic reaches your applications by enabling you to create security rules that block common attack patterns, such as SQL injection or cross-site scripting, and rules that filter out specific traffic patterns you configure.

H3 EFS vs S3 vs EBS

EFS	S3	EBS
Shared File System	S3 is Object Storage	Elastic Block Storage
! Remember - One EFS can be used to support MANY EC2 instances. EFS is based on Network File System (Unix / Linux)	Provides a Flat hierarchy of storage. The topmost level containers are called Buckets. High scalability. Supports REST, SOAP & HTTP access.	EBS Volumes are durable, block-level storage volumes that can be attached to SINGLE EC2 instance only.
EFS is a Regional Service. Stores data across multiple AZs		
Ideal for Hierarchical data ie., Folders, Files. Ideal to store documents, Audit, E-papers, DB Backups, shared corporate directories, content management	Used mainly for Web applications files / objects / images storage. Can also store files, images, video, audio	Ideal for DB, Disk Images, VMS.
It provides a simple interface allowing you to create and configure file systems quickly and manages the file storage infrastructure for you, removing the complexity of deploying, patching, and maintaining the underpinnings of a file system.	Ideally used to host assets such as documents, images, and videos which can be referenced by web applications.	Most EC2 instance types use EBS for persistent storage.

H3 EBS Volume Types

- General Purpose SSD (gp2)
- Provisioned IOPS SSD (io1)
- Throughput optimized HDD (st1)
- Cold HDD (sc1)
- Magnetic (standard, a previous generation type)

Family	Hint	Purpose/Design
D	DATA	Heavy data usage (e.g. file servers, DWs)
R	RAM	Memory optimised
M	MAIN	General purpose (e.g. app servers)
C	COMPUTE	Compute optimised
G	GRAPHICS	Graphics intensive workloads
I	IOPS	Storage I/O optimised (e.g. NoSQL, DWs)
F	FAST	FPGA hardware acceleration for applications
T	CHEAP (think T2)	Lowest cost (e.g. T2-micro)
P	GPU	GPU requirements
X	EXTREME RAM	Heavy memory usage (e.g. SAP HANA, Apache Spark)

H3 EKS

[More about EKS](#)

Amazon Elastic Container Service for Kubernetes (EKS) is a managed service for you to run Kubernetes on AWS, without needing to install, operate or maintain your own Kubernetes control panel.

H3 IAM Policies vs Bucket Policies

[Distinction between IAM & S3 Bucket Policies](#)

IAM Policies	S3 Bucket Policies
IAM policies specify what actions are allowed or denied on what AWS resources (e.g. allow ec2:TerminateInstance on the EC2 instance with instance_id=i-8b3620ec). You attach IAM policies to IAM users, groups, or roles, which are then subject to the permissions you've defined.	S3 bucket policies, on the other hand, are attached only to S3 buckets. S3 bucket policies specify what actions are allowed or denied for which principals on the bucket that the bucket policy is attached to (e.g. allow user Alice to PUT but not DELETE objects in the bucket).
AWS User account centric	AWS S3 bucket centric
What can this user do in AWS ?	Who can access this S3 bucket ?

Use IAM policies if:

- You need to control access to AWS services other than S3. IAM policies will be easier to manage since you can centrally manage all of your permissions in IAM, instead of spreading them between IAM and S3.
- You have numerous S3 buckets each with different permissions requirements. IAM

policies will be easier to manage since you don't have to define a large number of S3 bucket policies and can instead rely on fewer, more detailed IAM policies.

- You prefer to keep access control policies in the IAM environment.

Use S3 bucket policies if:

- You want a simple way to grant cross-account access to your S3 environment, without using IAM roles.
- Your IAM policies bump up against the size limit (up to 2 kb for users, 5 kb for groups, and 10 kb for roles). S3 supports bucket policies of up to 20 kb.
- You prefer to keep access control policies in the S3 environment.

If you're still unsure of which to use, consider which audit question is most important to you:

- If you're more interested in “ **What can this user do in AWS?** ” then IAM policies are probably the way to go. You can easily answer this by looking up an IAM user and then examining their IAM policies to see what rights they have.
- If you're more interested in “ **Who can access this S3 bucket?** ” then S3 bucket policies will likely suit you better. You can easily answer this by looking up a bucket and examining the bucket policy.

H3 AWS Transit Gateway

! Remember Hub & Spoke configuration

AWS Transit Gateway is a service that enables customers to connect their Amazon Virtual Private Clouds (VPCs) and their on-premises networks to a single gateway. This allows you to connect your on-premise network and all your VPCs in a hub and spoke configuration which significantly simplifies management and reduces operational costs because each network only has to connect to the Transit Gateway and not to every other network.

? Which AWS service enables you to connect multiple VPCs configured as a hub that controls how traffic is routed among all the connected networks which act like spokes?

Answer: AWS Transit Gateway

H3 AWS Global Accelerator

AWS Global Accelerator is a service that improves the availability and performance of your applications with local or global users.

- It provides static IP addresses that act as a fixed entry point to your application endpoints in a single or multiple AWS Regions, such as your Application Load Balancers, Network Load Balancers, or Amazon EC2 instances.

H3 **AWS VPC Peering**

VPC Peering allows you to connect 2 peer-peer VPCs together

- It does not enable you to centrally manage multiple VPCs connections centrally.

H3 **AWS Virtual Private Gateway**

Component of your site-to-site VPN connection that needs to be configured to build out a VPC tunnel with your on-premise network.

H3 **AWS X-Ray**

Remember microservice architecture - enable developers to debug & analyze production distributed applications

AWS X-Ray helps developers analyze & debug production, distributed applications, especially those built using a microservice architecture

- With X-Ray, you can understand how your application & its underlying services are performing.
- To identify & troubleshoot the root cause of performance issues & errors.

H3 **AWS CloudTrail**

Remember - Auditing across your AWS infrastructure

H3 **AWS Trusted Advisor**

Provides real-time guidance following AWS best practices.

- 7 AWS Trusted Advisor checks for Basic & Developer billing model
- All AWS Trusted Advisor checks for Business & Enterprise billing model

H3 **AWS Kinesis Firehose**

Remember Video streaming integration with S3, Redshift, Elasticsearch

Amazon Kinesis Data Firehose provides a simple way to capture, transform, and load streaming data with just a few clicks in the AWS Management Console.

- It is integrated with Amazon S3, Amazon Redshift, and Amazon Elasticsearch Service and you can capture, transform, and load streaming data.
- From the AWS Management Console, you can point Kinesis Data Firehose to an Amazon S3 bucket, Amazon Redshift table, or Amazon Elasticsearch domain.

H3 AWS Kinesis Video Streams

Remember Video streaming for analysis

Amazon Kinesis Video Streams makes it easy to securely stream video from connected devices to AWS for analytics, machine learning (ML), playback, and other processing. Kinesis Video Streams automatically provisions and elastically scales all the infrastructure needed to ingest streaming video data from millions of devices.

H3 AWS Athena

Analyse S3 data using interactive SQL queries. Also serverless.

Amazon Athena is an interactive query service that makes it easy to analyze data in Amazon S3 using standard SQL. Athena is serverless, so there is no infrastructure to manage, and you pay only for the queries that you run.

H3 NAT Gateway

'NAT Gateway', is used to enable Internet access for servers deployed in the private subnet

H3 Amazon Macie

! Remember MACIE is present in MACHINE LEARNING

- Amazon Macie is a security service that uses machine learning to automatically discover, classify, and protect sensitive data in AWS.
- Amazon Macie recognizes sensitive data such as personally identifiable information (PII) or intellectual property (such as your corporate application source codes) and provides you with dashboards and alerts that give visibility into how this data is being accessed or moved.
- The fully managed service continuously monitors data access activity for anomalies and generates detailed alerts when it detects the risk of unauthorized access or inadvertent data leaks.
- Amazon Macie is available to protect data stored in Amazon S3.

H3 Amazon Glacier

About Amazon S3 Glacier

Amazon S3 Glacier and S3 Glacier Deep Archive are a secure, durable, and extremely low-cost Amazon S3 cloud storage classes for data archiving and long-term backup. They are designed to deliver 99.999999999% durability, and provide comprehensive security and compliance capabilities that can help meet even the most stringent regulatory requirements.

- Customers can store data for as little as \$1 per terabyte per month, a significant savings compared to on-premises solutions.
- To keep costs low yet suitable for varying retrieval needs, Amazon S3 Glacier provides three options for access to archives, from a few minutes to several hours, and S3 Glacier Deep Archive provides two access options ranging from 12 to 48 hours.
- Expedited retrievals typically return data in 1-5 minutes, and are great for [Active Archive](#) use cases.
- Standard retrievals typically complete between 3-5 hours, and work well for less time-sensitive needs like backup data, media editing, or long-term analytics.
- Bulk retrievals are the lowest-cost retrieval option, returning large amounts of data within 5-12 hours. The Amazon S3 Glacier Deep Archive storage class provides two retrieval options ranging from 12-48 hours.

H3 Amazon Snowball

[About Amazon Snowball](#)

Snowball moves terabytes of data in about a week. You can use it to move things like databases, backups, archives, healthcare records, analytics datasets, IoT sensor data and media content, especially when network conditions prevent realistic timelines for transferring large amounts of data both into and out of AWS.

With Amazon Snowball, you can transfer 100s of Terabytes or Petabytes of data between your on-premise data centres & Amazon Simple Storage Service (S3).

- Snowball can import to S3 or export from S3
- Snowball - 80TB (upto 50TB allowed in the USA)
- Snowball Edge - 100TB comes with onboard storage & compute capabilities
- Snowball supports specific Amazon EC2 instance types and AWS Lambda functions, so you can develop and test in the AWS Cloud, then deploy applications on devices in remote locations to collect, pre-process, and ship the data to AWS.
- Common use cases include data migration, data transport, image collation, IoT sensor stream capture, and machine learning.

H3 AWS Batch

[More about AWS Batch](#)

With AWS Batch, you can simply - package the code for you batch jobs, specify their dependencies & submit your batch jobs to AWS management console, CLI or SDK.

- Batch jobs allow you to execution parameters & job dependencies & facilitate integrations
- Eg: Pegasus, WMS, Luigi, AWS Step functions
- AWS Batch jobs can efficiently scale your EC2 & Spot instances based on the requirements of your jobs.

H3 **AWS Storage Gateway**

AWS Storage gateway is a Hybrid cloud storage which makes it easier for you to connect your On-Premise environment with AWS cloud.

- AWS Storage Gateway seamlessly connects your local production or backup applications with NFS, SMB, iSCSI, or iSCSI-VTL

H3 **CloudWatch**

Cloud watch is for performance monitoring & Log retention

Cloudwatch can monitor the following resources

- Amazon DynamoDB tables
- Amazon RDS DB instances
- EC2 instances
- Custom metrics developed by your application & servers
- Custom logs by your application

H3 **! CloudWatch Retention Information**

Cloudwatch retains metric data as follows:

- Data points with a period < 60 seconds are available for a period of 3 hours. High res custom metrics
- Data points with a period of 60 seconds (1 min) are available for a period of 15 days
- Data points with a period of 300 seconds (15 mins) are available for period of 63 days
- Data points with a period of 36000 seconds (1 hour) are available for period of 455 days (15 months)

H3 **! Cloudwatch Monitoring**

- **Basic Monitoring** - 5 mins (free for EC2, ELBs, EBS & RDS DBs)
- **Detailed Monitoring** - 1 min (Chargeable)

H3 **CloudTrail**

Is used for auditing purposes and logs activities between your AWS resources

- delivers log files to Amazon S3 Bucket
- saves history of AWS API Calls
- Visibility of user activity by logging actions taken on your AWS account
- Not enabled by default

H3 **AWS SNS - Simple Notification Service**

AWS webservice which makes it easier to setup, operate & send notifications from the cloud. Can send manual or automated messages to Email, Mobile, SQS & HTTP endpoints.

- Message Data types are JSON data types. Messages are string based formatted only

H3 **AWS SWF - Simple Workflow Service**

Amazon SWF helps developers build, run & scale background jobs that have parallel or sequential steps.

H3 **AWS SQS - Simple Queue Service**

Fully managed Message Queueing Service that enables you to decouple & scale Microservices, Distributed systems & Serverless Applications.

H3 **AWS SES - Simple Email Service**

Cloud-based email service which helps digital marketers & application developers send marketing notifications & transactional messages

- Message can be HTML based rich text formatted.

H3 **AWS QuickStarts**

Quick starts are built by AWS architects & partners to help you deploy popular solutions on AWS, based on AWS best practices for security & high availability

- Implement key technologies automatically
- Single click, less than an hour
- Leverages Cloud Formation (remember Infrastructure as Code)

H3 **AWS KMS - Key Management Service**

Key Encryption on AWS Service level

AWS KMS gives you centralized control over encryption of keys used to protect your data

- Import, Rotate, Disable, Enable, Apply usage policies & Audit
- Integrated with other AWS Services

- Also integrated with CloudTrail
- 1 click encryption using AWS console or by using AWS SDK

H3 **AWS HSM - Hardware Security Model**

User defined Key encryption on Application level

Cloud based Hardware security model that lets you define your own keys and use them in your application

- Manage your own keys using FIPS 140-2 Level 3
- Use industry standard APIs - PKCS#11, Java cryptography extension (JCE), Microsoft CryptoNG libraries (CNG)
- Uses an agent installed on EC2 instances
- EC2 instances must be tagged

H3 **AWS ElastiCache - ES**

Amazon ES offers **Redis & Memcached**.

- Seamlessly deploy, run & operate open-source in-memory compatible data-sources
- Amazon elasticsearch can significantly improve latency & throughput of read-heavy applications such as Social Networking, Games, Media Sharing & Q&A Portals

H3 **AWS Neptune**

With AWS Neptune, you can create sophisticated, interactive graph applications which can query billions of data in seconds.

- SQL Queries for Highly-connected datasets is difficult to tune for performance
- Amazon Neptune allows you to use Graph query languages - TinkerPop Gremlin & W3C's SPARQL

H3 **AWS SMS - Server Migration Service**

- AWS SMS is an agentless service which makes it easier and faster for you to migrate thousands of On-Premise workloads to AWS cloud.

H3 **AWS CodeStar**

[More about AWS CodeStar](#)

- AWS codestar allows you to quickly develop, build & deploy applications to AWS Cloud
- Has many project templates which you can use to configure AWS Lambda, Elastic

Beanstalk and Amazon EC2 instances

- Support Java, Javascript, PHP, Ruby & Python
